Building Financial Software on Solana

Building Financial Software on Solana is the definitive guide to turning financial products into Solana programs, the code other blockchains call smart contracts.

It builds ten complete financial products each from the primitives up, including order book based exchanges, betting markets, automated market makers, borrow/lend markets, options exchanges, and perpetual futures.

Every Solana mechanism and every financial concept is built from first principles, with named characters, real dollar amounts, well known assets, and diagrams explaining each step.

Frameworks churn; this book teaches the Solana fundamentals that don't. Accounts, instruction handlers, the arithmetic of money, and the checks to ensure your program can hold funds in an adversarial environment. Code for every program, in all popular Solana frameworks lives in an open companion repository that's always up to date.

- Master Solana's account model, transactions, instructions, programs, instruction handlers and finality from a finance-engineering perspective
- Build and deploy Solana programs focused around stablecoins, tokenized assets, and onchain markets
- Work from production-grade patterns in the book's open companion repository
- Use the companion AI skill to create, reason about, and understand Solana programs
- Understand threats, financial math and model proofs

Mike MacCana creates Solana content at Quicknode. He has taught Solana to hundreds of thousands of people on YouTube, is a top-ten contributor on Solana StackExchange, a 2 x winner at the Sandstorm hackathon, and has created multiple popular Solana libraries.

Quicknode is a Y Combinator–backed company, and one of the world's largest blockchain infrastructure providers.
