Building Financial Software on Solana

Blockchains are moving into traditional markets — and the engineers building that software need more than API docs. This book is a practical, tested guide to building financial systems on Solana: payments, tokenized assets, and on-chain markets, treated with the rigor business software demands.

Every example is drawn from the book's companion repository — the most comprehensive open library of tested Solana programs, maintained at Quicknode — so the code you learn from is code that runs in production.

- Build and deploy Solana programs for payments, tokenized assets, and on-chain markets
- Work from production-grade patterns in the book's open companion repository
- Integrate wallets, transactions, and real-time data into business applications
- Master Solana's account model, fees, and finality from a finance-engineering perspective
- Ship with confidence: testing, security, and operational best practice throughout

Mike MacCana creates Solana content at Quicknode, maintaining the most comprehensive open library of tested Solana programs — the companion repository this book is built on. He previously ran developer education at the Solana Foundation, co-creating the Developer Bootcamp watched 324,000 times. He is a top-ten contributor on Solana StackExchange and the author of solana-helpers (30,000 weekly downloads).

Quicknode is a Y Combinator–backed company, the first commercial RPC provider to support Solana, and one of the world's largest blockchain infrastructure providers.
