Building Financial Software on Solana

Building Financial Software on Solana is the definitive guide to how financial products work as Solana programs, the code other blockchains call smart contracts.

It is written for engineers shipping software that holds other people's assets, and for the analysts, risk officers, product managers, and founders who need to understand that software.

It builds ten complete, tested programs, from a two-party escrow to a perpetual futures venue, each explained with named participants, real dollar amounts, well known assets, and diagrams for every step.

It teaches the layer that does not change: accounts, instruction handlers, the arithmetic of money, and the checks that let a program hold funds in an adversarial environment.

For software engineers, the open companion repository implements every program in all popular Solana frameworks and stays up to date with the latest releases of Solana and each framework.

> *"If this book had existed sooner, I would have been very early to Solana. It's still very early. First inning. All financial and AI players need to pick this book up and start building."*
>
> — IQRAM MAGDON-ISMAIL, COFOUNDER OF VENMO

- Understand how financial products work on Solana: where the assets are held, how they're recorded, how they move, and who gains and loses in each scenario.
- Learn Solana's accounts, transactions, instruction handlers, tokens and finality as they apply to software that holds money
- Build and deploy Solana programs for custody, pooled funds, markets, credit, and derivatives, from tested code in the book's open companion repository
- Use the companion AI plugin to create, reason about, and understand Solana programs
- Understand real world threats and how programs are defended

Mike MacCana has taught Solana to hundreds of thousands of people on YouTube, is a top-ten contributor on Solana StackExchange, a 2 x winner at the Sandstorm hackathon, and has created multiple popular Solana libraries.

Quicknode is a Y Combinator-backed blockchain infrastructure provider used by the largest banks, card companies, and trading firms in both finance and Solana.
